SELECTED ENGINEERING WORK

Voyager / Elodin

Open-source contributor

Contributed position/velocity error telemetry against SPICE reference data and an optional heliocentric relative gravity model to Elodin's Voyager example. PR #769 and PR #789 merged. A reconstructed Jupiter validation case (#805) remains in review.

AegisLand

Independent perception-reliability research

Built simulation experiments, supervisory estimation variants, evaluation protocols, and a public result archive. Phase 10R evaluated 1,440 truth-visible frames: mean error improved, but tail, miss-rate, and uncertainty-coverage gates failed. Kept the failed holdout result frozen. Simulation only. Source and results.

AbstainBench

Independent language-model evaluation project

Built a 30-question browser benchmark measuring correct answers, hallucinations, and false abstentions, with JSON/Markdown export. Includes a transparent offline baseline and optional local WebLLM inference. The offline baseline checks the evaluation pipeline, not model quality. Source.

Seagulls / OpenStage

AI engineering intern

Work on model routing, memory boundaries, tracing, guardrails, and QA, with attention to assistant behavior across product paths.

TOOLS & EDUCATION

Python, JavaScript, SPICE, Elodin, computer vision, PX4/Gazebo, WebLLM and WebGPU.

High school student at River Islands High School. Interests include aerospace simulation, perception reliability, and applied AI.
